...always watch what you say!

The screenshot shows a web browser displaying an article on the Infosecurity Magazine website. The browser's address bar shows the URL: `infosecurity-magazine.com/news/uk-cyber-disaster-security/`. The page header includes the Infosecurity Group logo and navigation links for 'MAGAZINE', 'EVENTS', and 'INSIGHT'. A prominent yellow banner advertises an 'Online Summit' for '22-23 MARCH 2022', featuring '14 SESSIONS' and '11 CPES' over '2 DAYS', with a 'REGISTER NOW' button. Below this, the 'info security' logo is displayed with the tagline 'STRATEGY | INSIGHT | TECHNOLOGY' and a 'Latest' article preview: 'HEAT: Are Companies Prepared for Modern Threats?'. A dark navigation bar contains links for 'News', 'Topics', 'Features', 'Webinars', 'White Papers', 'Podcasts', 'Events & Conferences', and 'Directory'. The breadcrumb trail reads: 'INFOSECURITY MAGAZINE HOME » NEWS » #DSbD: UK COULD FACE A “CYBER DISASTER” ON ITS CURRENT SECURITY TRAJECTORY'. The main article header features a blue and white graphic with binary code and a padlock, with the title: '#DSbD: UK Could Face a “Cyber Disaster” on its Current Security Trajectory'. The article is dated '9 MAR 2022' and is categorized as 'NEWS'. The author is identified as 'James Coker, Reporter, Infosecurity Magazine', with a 'Follow @ReporterCoker' link. The article's first sentence is: 'The UK could be heading for a “cyber disaster” if it continues with its current approach to cybersecurity. This was the message of Professor John Goodacre, challenge director – Digital Security by Design, UKRI, and Professor of Computer Architecture, The University of Manchester'. A small thumbnail for 'Q1 ISSUE OUT' is visible in the bottom right corner of the article preview.

Cyber security today

- Focused on mitigations and keeping up with the patches
 - Primary responsibility falls to those using rather than those building systems
 - Costly, disruptive, with no defence against flaws and errors.
- Today's technology has developed during a period where performance and cost are more important than cyber security
- There is increasing need for business to ask the questions:
 - How can technology providers provide more secure products by default ?
 - How can technology itself offer more protection by design ?

Can we actually “prevent computer security vulnerabilities” with today’s solutions ?

- Will being alerted to abnormal bandwidth remove the vulnerability in the computer?
- Will blocking some sites remove the vulnerability that some another site is trying to use?
- How can watching trends prevent a vulnerability?
- Will looking at reports and the cost of risk prevent a vulnerability?

How to prevent computer security vulnerabilities

[Try it free](#) [Learn more >](#)

- ▶ Staying on top of bandwidth usage with alerts when devices exceed thresholds
- ▶ Blocking users from visiting suspected and confirmed unsafe sites
- ▶ Setting unblocked lists and blocked lists to override category based filters
- ▶ Applying Web Bandwidth checks
- ▶ Filtering Internet activity by day, category and URL to reveal trends, spikes and irregularities
- ▶ Completing with detailed reporting tools to let you analyze browsing activity and demonstrate the effectiveness of web security
- ▶ Identifying risks with our  online software to tell you where it is and places a dollar value to the risk of it being there

Why Does DSbD Exist?

Creating an economy that boosts productivity and earning power throughout the UK

UK Research and Innovation

- 2018: UKRI asked industry “what are your challenges ISCF could help solve?”
- Described a failure in market dynamics that was stopping industry from introducing new technology to block vulnerabilities
- Funding announced Jan 2019
 - Programme designed in collaboration

Press release

'Designing out' cyber threats to businesses and personal data

On Data Privacy Day, Business Secretary Greg Clark announces measures for the UK to become a world leader in the race against some of the most damaging cyber security threats.

From: [Department for Business, Energy & Industrial Strategy, Innovate UK, UK Research and Innovation, The Rt Hon Greg Clark MP, and Margot James](#)
Published: 28 January 2019

ISCF DSbD Challenge Vision

By 2025, the ISCF Digital Security by Design challenge aims to **overcome the market failures** and **radically update the foundation of the insecure digital computing infrastructure** that underpins the entire economy. A new and secure computer hardware approach, proven in at least two major industrial markets, will protect against at least half of known and associated future technological vulnerabilities

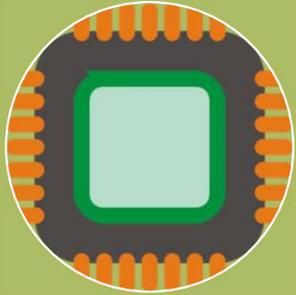

Working up for the first time from the central hardware of a digital device

DSbD is an initiative supported by the UK government to transform digital technology and create a resilient, and secure foundation for a safer future.

Approach: Cross-Cutting Activities

Enabling Technology

Prototype Platform

Deliver a proven secure-by-default hardware evaluation board and system software

Technology Sector

Collaborative R&D

To enable market use, tooling and processes to utilise the new security capabilities; ecosystem enablement

Industry Sector

Business-led Demonstrators and Technology Access Programme

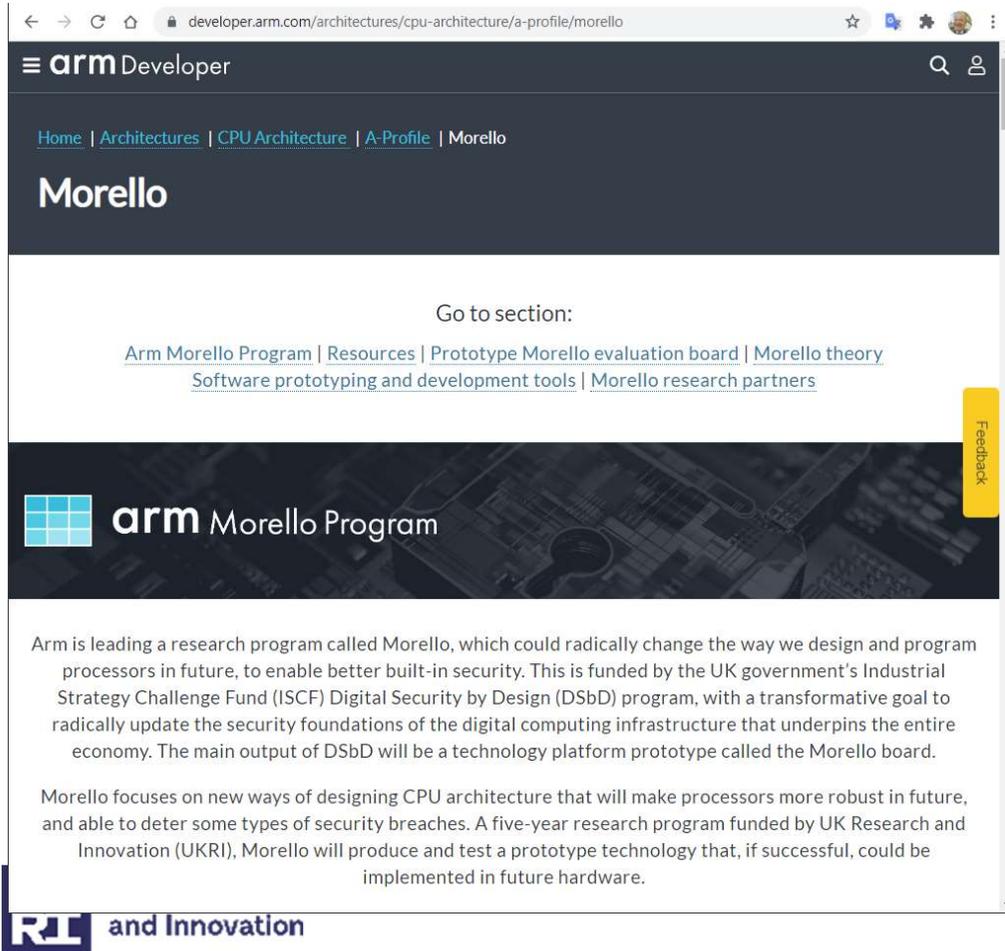

Sector defined applications showcase impact and move the accepted norm

1. DSbD Enablers

2. Technology Developers

3. End Markets

Realizing the Technology Platform Prototype

The screenshot shows a web browser window with the URL `developer.arm.com/architectures/cpu-architecture/a-profile/morello`. The page header includes the ARM Developer logo and navigation links: Home, Architectures, CPU Architecture, A-Profile, and Morello. The main heading is "Morello". Below this, there is a "Go to section:" area with links to "Arm Morello Program", "Resources", "Prototype Morello evaluation board", "Morello theory", "Software prototyping and development tools", and "Morello research partners". A "Feedback" button is visible on the right side. The main content area features the ARM Morello Program logo and a paragraph stating: "Arm is leading a research program called Morello, which could radically change the way we design and program processors in future, to enable better built-in security. This is funded by the UK government's Industrial Strategy Challenge Fund (ISCF) Digital Security by Design (DSbD) program, with a transformative goal to radically update the security foundations of the digital computing infrastructure that underpins the entire economy. The main output of DSbD will be a technology platform prototype called the Morello board." Below this, another paragraph states: "Morello focuses on new ways of designing CPU architecture that will make processors more robust in future, and able to deter some types of security breaches. A five-year research program funded by UK Research and Innovation (UKRI), Morello will produce and test a prototype technology that, if successful, could be implemented in future hardware." At the bottom left, there is a logo for "UKRI and Innovation".

Press release

Confronting cyber threats to businesses and personal data

British businesses and the public are set to be better protected from hostile cyber-attacks and online threats like disinformation and cyber-bullying.

From: [Department for Business, Energy & Industrial Strategy, Department for Digital, Culture, Media & Sport, Home Office, UK Research and Innovation, The Rt Hon Andrea Leadsom MP, and Matt Warman MP](#)
Published: 18 October 2019

- Leading technology firm Arm is working with government to strengthen cyber security measures for businesses and the public
- £36 million investment will help make the UK a world leader in tackling many forms of cyber threats to online products and services
- Around a third of businesses report having cyber security breaches or attacks in the last 12 months – with cyber threats constantly evolving

EPSRC Competition

- £10M Academic Research funding
 - £7M from ISCF/DSbD
 - £3m from DCMS
- Building long-term skills and thought leadership
- The EPSRC call covered 3 areas:
 - Capability enabled hardware proof and software verification
 - Impact on system software and libraries
 - Future implications of capability enabled Hardware

Active Projects

AppControl: Enforcing Application Behaviour through Type-Based Constraints
Dr Wim Vanderbauwhede (University of Glasgow)

CapableVMs

Dr Laurence Tratt (King's College London) & Dr Jeremy Singer (University of Glasgow)

CAPcelerate: Capabilities for Heterogeneous Accelerators

Dr Timothy Jones (University of Cambridge)

CapC: Capability C semantics, tools and reasoning

Dr Mark Batty (University of Kent)

CAP-TEE: Capability Architectures for Trusted Execution

Dr David Oswald (University of Birmingham)

CHaOS: CHERI for Hypervisors and Operating Systems

Dr Robert Watson (University of Cambridge)

CloudCAP: Capability-based Isolation for Cloud-Native Applications

Prof Peter Pietzuch (Imperial College London)

HD-Sec: Holistic Design of Secure Systems on Capability Hardware

Professor Michael Butler (University of Southampton)

SCorCH: Secure Code for Capability Hardware

Dr Giles Reger (The University of Manchester)

Prof Daniel Kroening (University of Oxford)

ESRC – Discribe Hub+

Digital Security is more
than just technology

- Routes to adoption: readiness levels
- Routes to adoption: barriers for business
- Regulatory challenges: barriers and enablers
- Social, Cultural and Commercial sector differences

- **Hub+:** Acts as a hub-and-spoke network brokerage, develop agile, multidisciplinary networks between activities and stakeholders
- **Core Research** area include Adoption, Readiness, Regulation and Policy, and Across Contexts
- **Devolved Small Project Research Budget:** Started funding commercially-focused social science research on barriers to adoption

Seeks to understand the behavioural and adoption challenges in digital security, to investigate what it means to be secure and the commercial challenges of moving beyond the current security paradigms.

Funding: £3.5 million

<https://www.discribehub.org>

Development of the DSbD Software Ecosystem

Objective: Expand beyond the enabling Technology Platform software ecosystem and fund several additional **technology sector** projects to investigate and further enable DSbD technologies across developer environments, tools, OS, runtimes, frameworks and libraries

- **Initial SME focused Projects Completed**
 - 10 projects focused on design investigations
 - Provided feedback into the technology maturity
 - Discovered new and exciting ways to increase the security of their products.
- **Collaborative R&D Projects** starting Q2'22
 - Projects focused on extending and maturing the software ecosystem for developers wanting to use DSbD technologies
 - Will be provided with the prototype hardware

Business-led Demonstrator Activities

Objective: To develop demonstrators showcasing the use, adoption and impact of DSbD technologies within an **industry sector**

- **THG Holdings PLC, Manchester** will demonstrate and test the benefits of DSbD technology, to improve the security of **e-commerce** and enable the increased productivity and development of future world-leading services and products.
- **100% IT based in Newbury** will develop a demonstrator that will make it harder to attack and infiltrate **network infrastructure** or endpoints and remotely take control or extract sensitive information
- **Beam Connectivity, in Cirencester** will demonstrate and review the use of DSbD technologies for cyber critical and safety critical applications in the **automotive sector**
- **Southern Gas based in Horely** seeks to deliver an Internet of Things (IoT) demonstrator in the utility industry to deliver an enhanced security solution for applicability in **critical national infrastructure**
- **ICETOPE based in Rotherham** will work with industry standard bodies to address the lack of cooperation between Information Technology (IT) and Operational Technology (OT) in the **data centre**.

What's Next..

- **We need the Cyber Security discussion to extend into requiring technology providers to prioritize their products and services to build-in security by default**
- **We need the technologies that can protect software vulnerabilities from exploitation by design**
- **We need the technology providers to understand the new techniques and technologies that can help overcome the commercial and performance barriers to building in that security**
