

A Scenario of Migration: Findings of Household Listing in Origin Area

Survey of the GBM Delta, Bangladesh

Prodip K. Das* & Mohammad Rashed Alam Bhuiyan**

Refugee and Migratory Movements Research Unit (RMMRU)

DECCMA 5th Consortium Workshop, 30 Aug - 2 Sept 2016, India

Introduction

- Household Listing (HL) is a diminutive census of all individual households within an enumeration area (EA).
- The objective of the HL was to finalize those households which would be surveyed to collect further in depth information in DECCMA Household Social Survey.

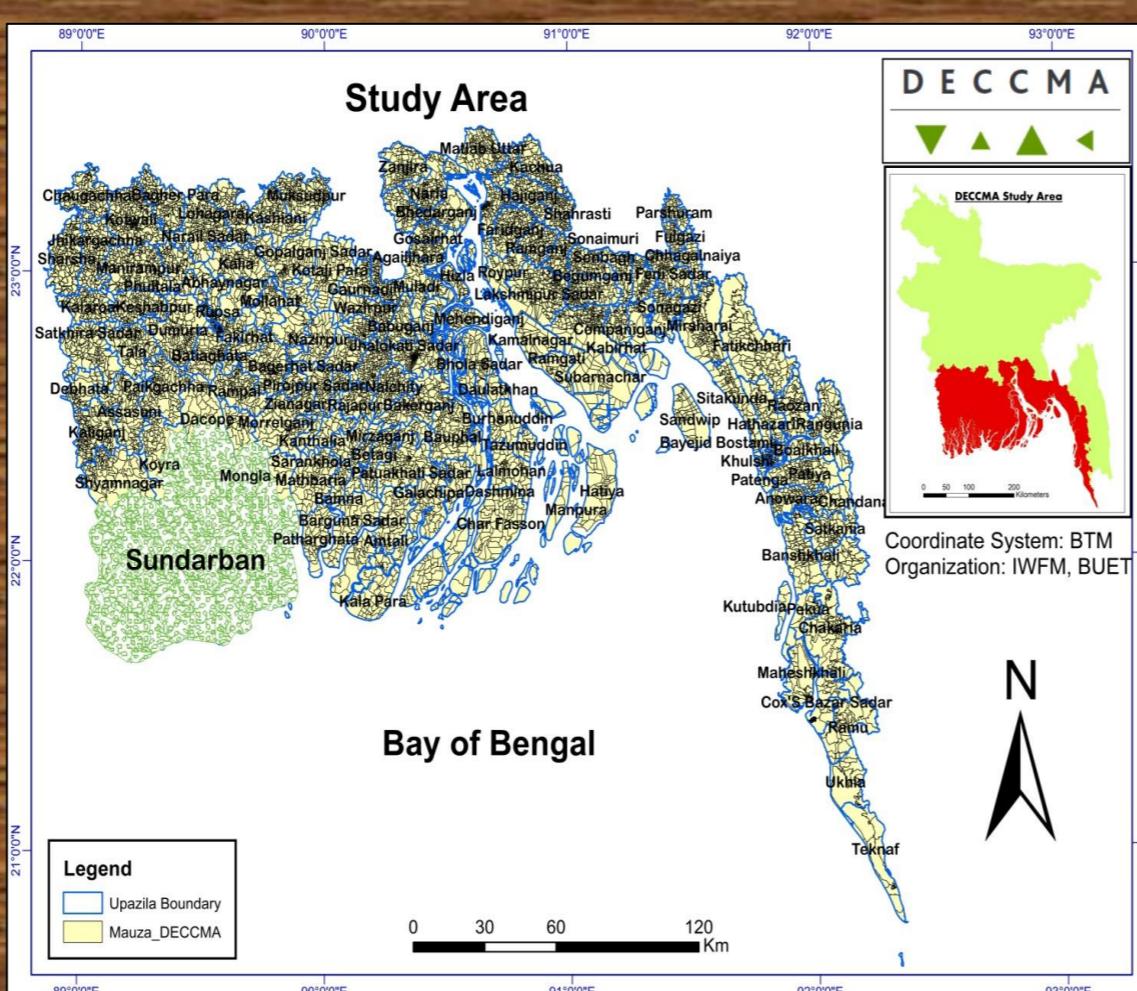

Study Area

- 19 Coastal districts
- 153 Upazilas
- 14771 Mauzas

Selection For DECCMA Study

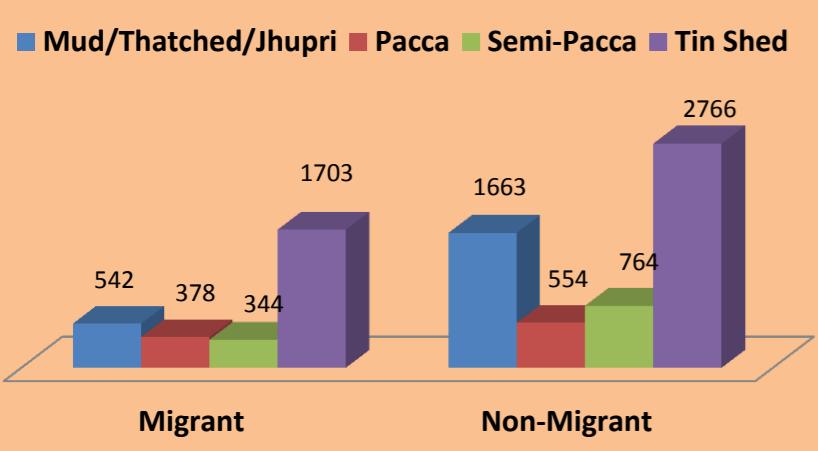

- 14 Coastal districts
- 41 Upazilas
- 50 Mauzas (EA)
- Each Mauza → 200 HHs listed

Unit of Analysis: Mouza

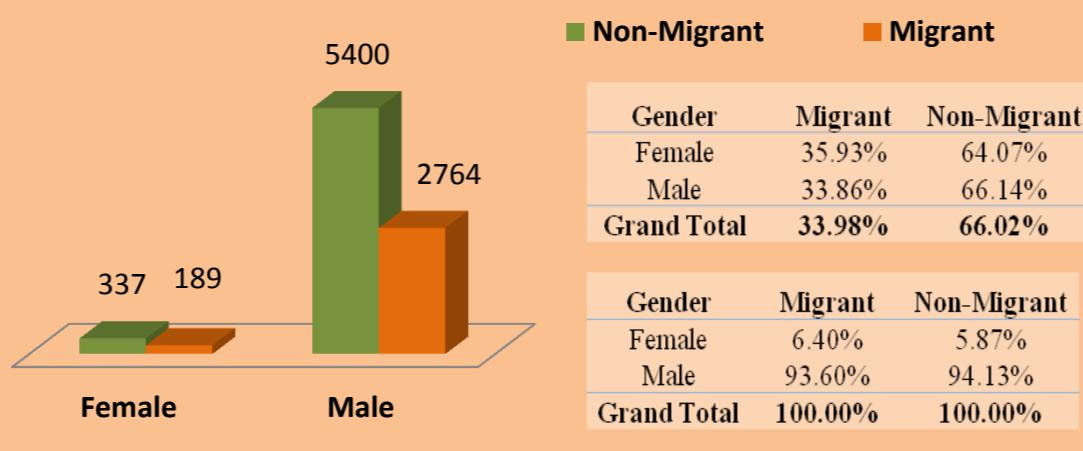

Study Findings

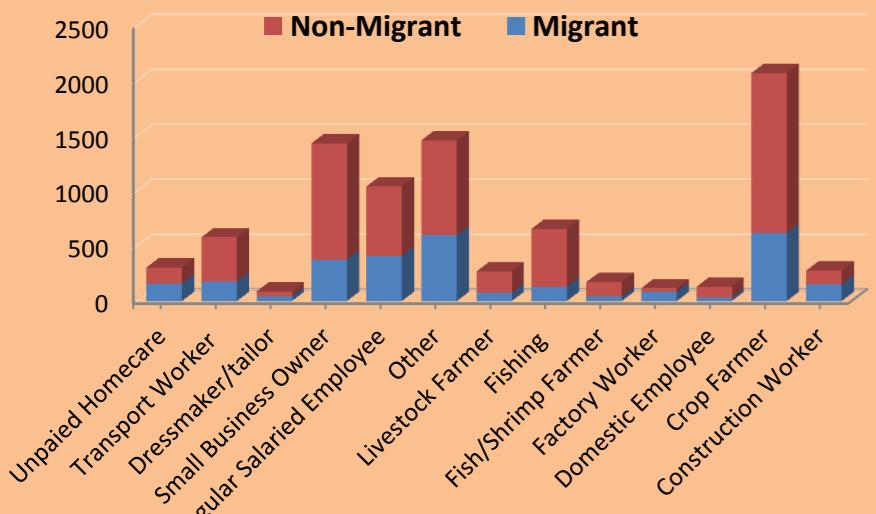

Dwelling-structure types of households

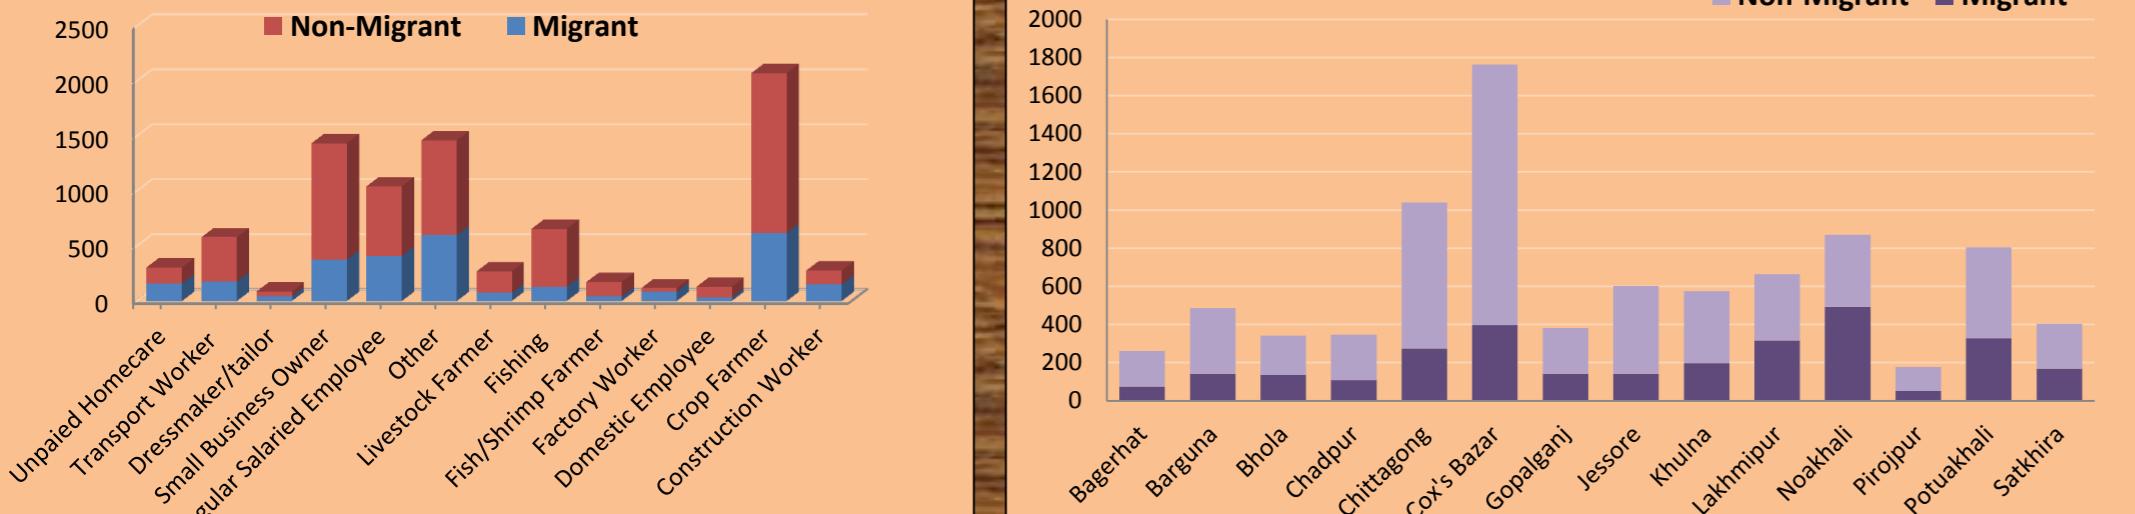

Gender of Household Head

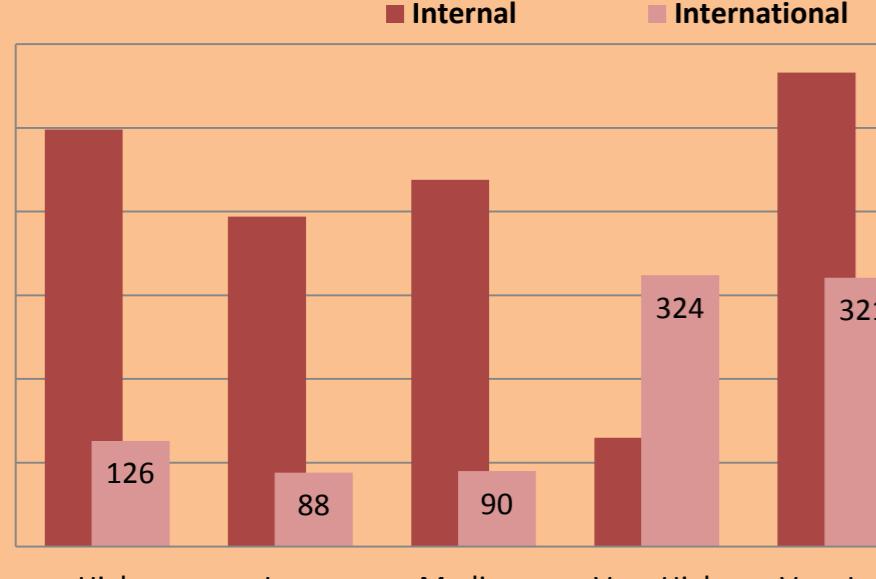

Occupation types of HH head

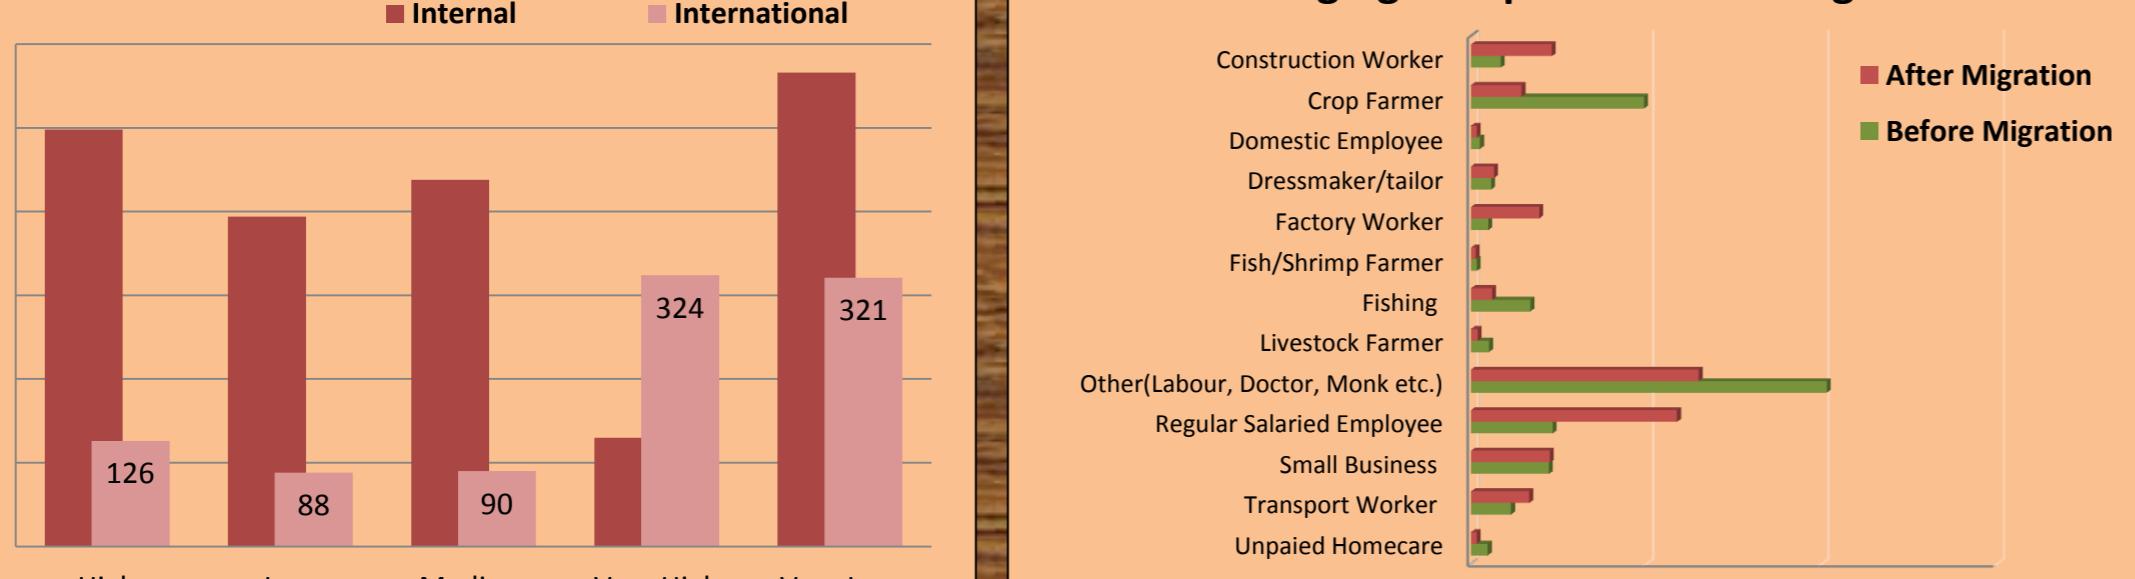

HHs distribution by district

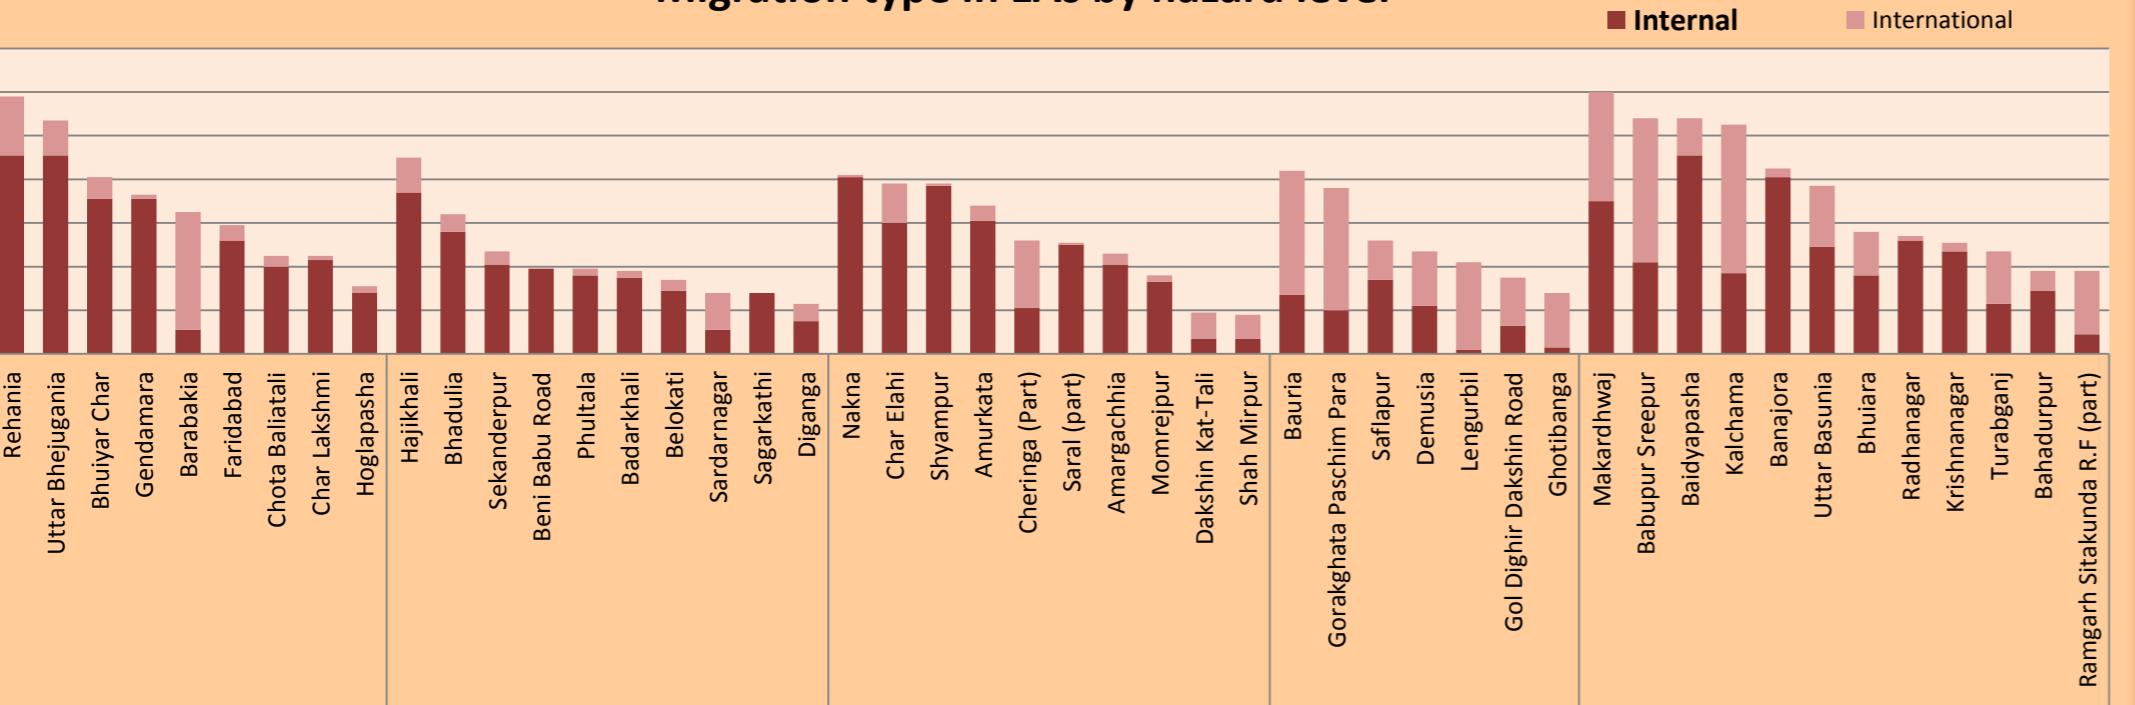

Comparing Migration Type by Hazard Level

Changing occupation due to migration

Migration type in EAs by hazard level

Conclusion

- 8713 HHs were listed and it was found that 34% of HHs (2962) are migrant HHs. Of these, almost 11% (949) are international migrant HHs, and 23% (2013) are internal migrant HHs, which is almost two or three times greater than existing estimates from most prior studies (HIES, 2010; Sharma and Zaman, 2009; Hossain, Kazal and Ahmed, 2013).
- Noakhali district had the highest rate of HHs with at least one migrant (56%), while Cox's Bazar had the lowest percentage of migrant HHs (22%). However, when only counting international migration, Cox's Bazar ranked first (271 HHs). A female was head of household in 12% of cases.
- Before migration 9% of HHs were involved in regular salaried employment (i.e. informal sector/Driving/Factory/Tailoring), and after migration 24% of migrants were involved in regular salaried employment (i.e. Construction/Factory/Transport worker).
- These findings reveal important policy requirements for managing internal migration, namely the implementation of a resilient and inclusive urban development strategy involving the relocation of industries.

Methodology

Development of Multi-hazard Map

$$WS_{max} + WE_{max} + Ws_{max} + WF_{max} = 1$$

Maximum Weightage (W) for four hazards: Storm surge (S), Erosion (E), Salinity (Sa), Flood (F).

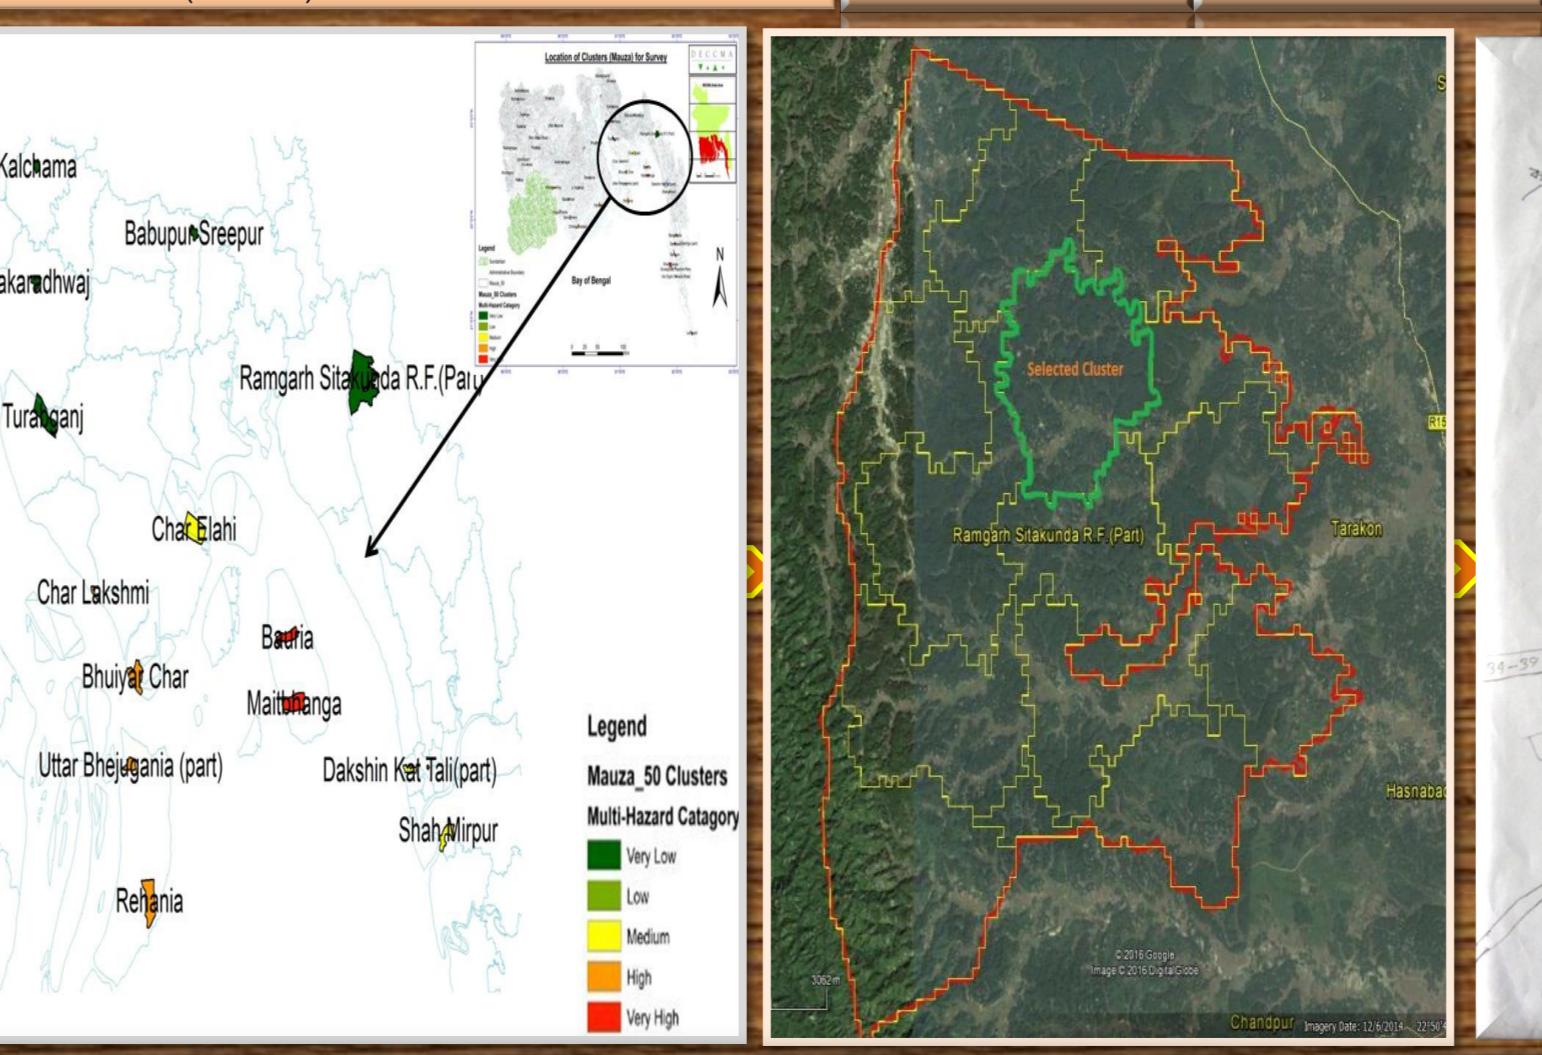

$$WS + WE + Ws + WF = 1$$

Weightage computed (W) for Storm surge (S), Erosion (E), Salinity (Sa), Flood (F).

$$H_{multi-hazard} = H_{storm} + H_{erosion} + H_{salinity} + H_{flood}$$

Weightage Calculation

	Hazard Type	Weightage
i. Social damage	Storm surge	0.323
ii. Economics damage	Flood	0.098
	Salinization	0.278
	Erosion	0.308

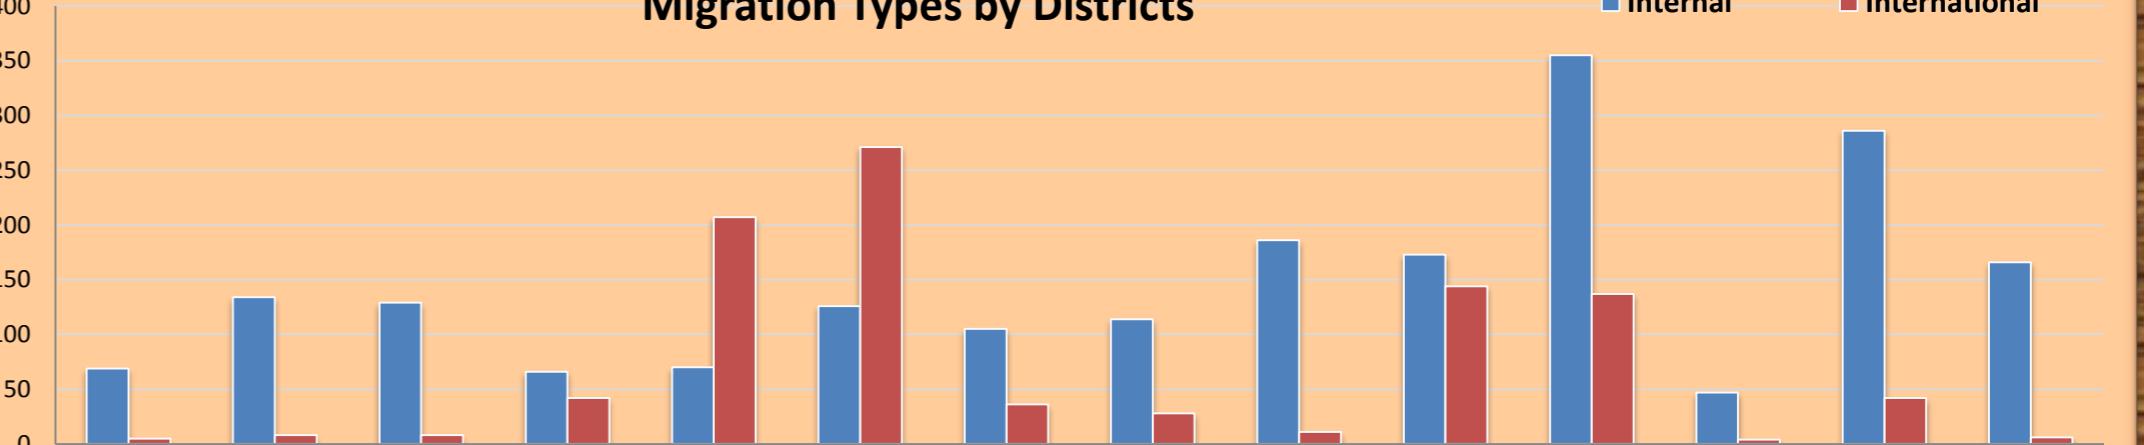

DECCMA PROJECT		HOUSEHOLD LISTING FORM	
EA NAME: Moheshkhali, Shapla Char		EA CODE: 20	
SERIAL NO. OF STRUCTURE	DETAILED DESCRIPTION OF STRUCTURE	RESENDED NUMBER OF STRUCTURE	NAME OF HEAD OF HOUSEHOLD
DS14	..	Y DS14	Polash Shil
DS15	..	Y DS15	Dr. Jagdip
DS16	..	Y DS16	Raja Kumar
DS17	..	Y DS17	Kajol
DS18	..	Y DS18	Profullo
Types of Structure:		Occupations: Household Head & Migrants	
1) Mud/Thatched/Bamboo/Jhupri	2) Tin Shed	7) Construction worker	12) Transport worker (e.g. rickshaw puller, taxi driver)
3) Pacca	4) Semi-Pacca	8) Domestic employee	13) Housekeeper
5) Other	6) Saloon	9) Regular salaried employee	14) Guard/gardener
		10) Self-employed	15) Migrant
		11) Shopkeeper	16) Other, please specify
NAME OF LISTER: Sifat Sharmin Jahanir			

Distribution of EA by hazard level and HH type

Migration Types by Districts

Method and Strategy for subsequent in-depth household survey

- Trained a survey team with Tablet/iPad (Equal male and female ratio)
- Gender-sensitive survey techniques
- Individualized questionnaire structures
- Multi-layer data checking
- Data uploaded to main server
