

*Current prospects for and the
future of Enabling Chemistry
Technology*

Stevan W Djuric, PhD

AbbVie

Dial-a-Molecule Annual Meeting,

Imperial College, London, UK

July 10th 2018

How Can Chemistry Technology help?

- Cycle Time
- Cost of Goods
- Improve overall PoS

$$\text{R and D Productivity} \sim \frac{\text{WIP.p (TS)}}{\text{CT}} \cdot \frac{1}{C} \cdot V$$

Paul et al (Lilly) NRDD 2010

Drug Discovery can be characterized as a race in which several firms pursue investigational drugs with similar chemical structures or with the same mechanism of action before any drug in the class obtains regulatory marketing approval

– J. A. DiMasi and L. B. Faden, NRDD, 2011, 10, p23.

Goal of AbbVie's HTC Facility

A centralized, highly automated, state-of-the-art, parallel synthesis facility that enables the discovery of more highly optimized biological tools and drug candidates

- Preparation of libraries of analogs designed to
- Rapidly generate structure activity relationships (SAR)
- Accelerate lead development and optimization

Benefits for AbbVie's Discovery Organization:

- ✓ More analogs = “more shots on goal”
- ✓ Libraries created more efficiently
- ✓ Project chemists focus on targets not amenable to parallel synthesis
- ✓ Quality and scope of SAR enhanced
- ✓ Libraries contribute to file enhancement

Overview of Library Production at AbbVie

Library Characteristics

- ✓ Solution Phase
- ✓ Individual, Pure Compounds
- ✓ Focused Chemical Space
- ✓ 48-144 Member Libraries
- ✓ 10-40 mg Scale
- ✓ Minimal Development
~ 2 Week Turnaround
- ✓ High Purities and Yields
- ✓ Fully Characterized Products

Enabling Tools

Mass-directed HPLC

- *SWIFT – A first in class compound library production engine*

SWIFT – Synthesis With Integrated Flow Technology

Next generation fully integrated synthesis/purification platform

Goal: Achieve a 4 day turn-around for

- ✓ *Method development*
- ✓ *Synthesis*
- ✓ *Purification*
- ✓ *Analysis*
- ✓ *Compounds ready for bioassay and storage*

SWIFT

Utilizing a segmented flow chemistry platform

SWIFT – Synthesis With Integrated Flow Technology

System Setup based on Accendo Conjure Reactor

- ✓ Product is purified by HPLC-MS while next in queue is being synthesized
- ✓ Standard 10 minute LC method, 1 fraction per reaction collected by MS trigger

SWIFT – Synthesis With Integrated Flow Technology

Flow Library Synthesis Process

Pre-weighed monomers dissolved by liquid handler

Flow

- *Synthesis in segmented flow*
- *10-30mg scale*
- *“In line” purification*
- *Chemistries dictated by solubility (up to 2 steps)*
- *2-4 day cycle time till registration*

Purification, fractionation

Proprietary software for library setup, fraction handling and data acquisition

Automated labelling of fraction (1 fraction/prd), over night dry down

final liquid handler sample transfer for NMR analysis, dry down and weighing (Tecan)

Reaction type

Acylation
 Urea formation
 Sulfonylation
 Reductive amination
 2-step acylation & deprotection
 2-step reductive amination & deprotection

Various heterocycle formations
 Pyrazole acylation
 Epoxide openings
 Carbamate formation
 One-pot Click chemistry

Storage in 2D bar-coded tubes

Centralized assay plate preparation

2011-2015 ~9.5k compounds synthesized, ~70% average success rate

Library Design Tool – Part of the AbbVie Designer Workbench

AbbVie Designer Workbench is a web-based collection of tools within SpotFire. The Library Design Tool is one of these tools available for Med Chem design.

The screenshot shows the 'Library Enumeration' section of the AbbVie Designer Workbench. It includes a 'Sketch' area with a 'Click to edit' button and radio buttons for 'None', 'ARoom SSS', and 'ARoom Sim'. Below these is a 'Minimum Similarity' dropdown set to '100' and a 'Submit' button. There is also an 'Upload' section with a 'Browse...' button and a 'Submit' button. The status bar at the bottom indicates 'No active visualization'.

The screenshot shows the 'Library Enumeration' section of the AbbVie Designer Workbench, displaying a chemical reaction. The reaction is: BrCc1nc(C)c(C(=O)O)s1 + R-OH → ROCc1nc(C)c(C(=O)O)s1. The interface includes a toolbar with various chemical drawing tools, a 'Reaction can be retrieved from a .cdx file represented as Core + Monomer -> Product' message, and a 'NEXT>>' button. The status bar at the bottom indicates 'No active visualization'.

Enumeration and Monomer Selection

Two enumerator engines available – ChemAxon and Pipeline Pilot

Monomer inputs available from multiple sources (e.g., Aldrich Market Select, AbbVie Proprietary Monomer Collection) with estimated delivery times

in silico ADME
Properties

Cystic Fibrosis is Driven by Defects in CFTR

Two Main Approaches to Fix CFTR

Potentiators restore the flow of ions through activated CFTR

- Ivacaftor (VX-770) approved

Correctors restore the processing of CFTR from to the surface

- Orkambi approved (Lumacaftor (VX-809)+ Ivacaftor)
- Need of type 1 (C1) corrector and type 2 (C2) corrector for maximum channel restoration

CFTR Correctors - Assays

$$I = n \cdot P_o \cdot \gamma$$

I = Total current
 n = Number of channels
 P_o = Open probability
 γ = Channel conductance

Localization Assays

CSE-HRP (Cell Surface Expression)

- CSE-HRP-tagged

Primary Human bronchial epithelial cells

Co-incubate
 Correctors with
 Potentiator overnight
 →
 Measure I_{eq} in TECC
 after Forskolin
 activation of CFTR

Functional Assays

HBE-TECC (Human Bronchial Epithelial- TransEpithelial Clamp Circuit)

- Primary **human bronchial epithelial** cells from **CF patients**
- E-Phys measurement of ion flux
- Measure (I_{eq}) current changes
- Gold standard for CFTR function and clinical efficacy correlation

SWIFT Platform applied to CFTR C1 corrector program

Proprietary amines

Proprietary acids

purification

Registration
and dispersal

Medicinal Chemistry Approach and Assay Funnel

- Compound design based on data analysis, experience, and cheminformatic tools
- Prospective property calculation
- Prioritization based on synthetic accessibility

- Data generation and analysis

- Library as well as individual compound generation
- Specialized synthetic chemists tackle novel cores and optimize routes

CFTR C1

Chromane SAR Exploration via Segmented Flow Based Libraries

	1	2	3	4	5
CSE-HRP (EC ₅₀ μM, Max. Act% C1 control)	2.6, 99%	4.1, 100%	>20, 8%	>10, 22%	2.7, 110%

- Chromane groups demonstrated unexpected activity
 - **From proprietary amine collection**
- Difference in stereochemistry observed
- C-2 phenyl analogs followed up: high efficacy, tunable SAR

CFTR C1

Chromane SAR Exploration-Contd

Compound		5	6	7	8	9
CSE-HRP (EC ₅₀ μM, Max. Act% C1 Control)		2.7, 110%	12, 33%	4.1, 77%	0.80, 92%	0.21, 119%
In Vitro ADME	Rat/Human Clint,u (L/hr/kg)- hep	470/49		580/110	460/110	230/77
	PAMPA Peff (x10 ⁻⁶ cm/s)	0.04	0.3	0.26	0.03	0.3

- C-2 phenyl potent/efficacious
- Substitution on distal phenyl important
- Compounds have high in vitro hepatocyte clearance (>>20L/hr/kg) and poor permeability (<1 x 10⁻⁶ cm/s))

CFTR Type 1 Correctors

Chromanes - Candidate Identification

Compound		13
In-Vitro Assay	HBE TECC	
	EC ₅₀ μM, Max %C1 standard	0.238, 95%
In Vitro ADME	Rat/Human Clint,u (L/hr/kg)- hep	25/17
	CYP 3A4 induction	Negative
In Vivo PK	Cl _p (%LBF) (rat)	< 30%
	T _{1/2} (hr);	3.3

17
0.009, 94%
15/3
Negative
< 30%
~3

- para-substituted acid **17** unexpectedly has improved potency, and reduced clearance
- Compound **18** was nominated as preclinical candidate – **ABBV-2222**

High Throughput Chemistry Technology – the Future

- Integrated Synthesis-purification –bioassay platforms
- Reaction scouting – High Throughput Experimentation techniques
 - Yields for reactions such as Buchwald, Negishi , Chan-Lam etc generally low in a parallel synthesis context (~20-30%)

- Robochemists
- AI based interpretation/ analysis of SAR data
- Virtual Reality enabled drug design

Integrated Synthesis-Purification-Bioassay platforms

- Compound synthesis and testing takes weeks. How about *Integrated chemistry – biology systems on chip?*

Stephanie Y. F. Wong-Hawkes, et al, GSK; 30th National Medicinal Chemistry Symposium, Washington, June 2006

- Key components – Synthesis and Purification using a microfluidic kit followed by in-line bioassay in flow.
 - New seed SAR followed by CADD of next compounds (need proprietary software)
- Subsequently, Cyclofluidic and Roche

Compound library production- Next steps

- Synthesis and purification of compounds using segmented flow technology – SWIFT Platform
- What's next?
 - Integrated Synthesis-purification-bioassay - **BIOSIP**

BioSIP - Fully Integrated Synthesis-Purification-Bioassay System

- Process needs to be achieved in a couple of days maximum
- Compounds will be made on small scale (1-2 mgs) and assayed.
 - Compounds of interest will be re-synthesized

Decisions:

1. Choice of projects e.g HtL
2. Choice of synthesis platform
3. Choice of method of compound quantitation
4. Choice of bioassay platform
 - Assay scope?

2.5 years in development

Integrated Synthesis – Purification - Bioassay System (BioSIP)

Goal: *Deliver primary bioassay data within 36 hr of start of synthesis*

✓ Particularly well-suited for early stage programs

Status:

- Implemented 9 libraries for Project A, 11 libraries for Project B and 2 libraries for Project C during 2016
- Average cycle time from *start of synthesis to bioassay data* < 24 h
- 5 Reaction chemistries: Acylation, Sulfonylation, Suzuki, Nucleophilic subn, Reductive amination
- Bioassay data shows very good correlation with data from HTS

2018 – routine use for HTL programs

Integrated Synthesis – Purification - Bioassay System (BioSIP)

Integrated Synthesis-Purification-Bioassay System.

ChemSpeed Synthesizer (1); Gilson HPLC (2); Thermo MSQ-Plus MS (3); Charged Aerosol Detector (4); Autosampler/fraction collector (5); Ultravap Mistral Evaporator (6); Twister III robotic arm (7); JANUS liquid handling workstation (8); Incubator (9); EnVision plate reader (10).

Solving Problems with Innovative Chemistry and Technology

Innovative
machine
assisted
chemistry

Process intensification: technologies to handle challenging aspects of synthesis; e.g. flow chemistry, reactor engineering, photochemistry, biocatalysis

Automation for preparative purposes, reaction optimisation and route scouting. Use of robotics and novel optimisation method

Modern chemical methodologies: e.g. photochemistry, electrochemistry, lead diversification

Example Project: The Challenge of Meaningful Automation

Easy to Automate

Experimental

Experiment 1. Pd C-N Coupling Reactions of 4-Phenylpiperidine 21 and 3-Bromopyridine 22: A Comparative Experiment between Reactions in 1536-Well and 96-Well Plate Microvials

Procedure for 96 Nanomolar Scale (1 uL volume) Reactions in a 1536-Well Plate (Run in Triplicate). Stock solutions of each of the reaction components were made as follows: 4-phenylpiperidine 21 (0.6 M in DMSO), 3-bromopyridine 22 (17, 0.4 M in DMSO), organic superbases (24-29, 0.8 M in DMSO, Figure S3), and Pd-precatalyst (30-45, 0.04 M in DMSO, Figure S4). For the 1536-well plate experiment, each of the solutions was dispensed in 75 uL charges to a 384-well source plate (source plate map is shown in Figure S5, components listed in Table S1).

Useful for Chemists

Procedure: A solution of *n*-butyllithium (2.50 M in hexanes, 27.96 mL, 69.9 mmol) was added via a cannula to a suspension of lithium chloride (9.39 g, 222 mmol) and diisopropylamine (10.6 mL, 75.3 mmol) in THF (50 mL) at -78 °C. It has been noted that the lithium chloride must be anhydrous and flame-dried immediately before use. The resulting suspension was warmed to 0 °C briefly and then cooled to -78 °C. An ice-cooled solution of the amide (8.12 g, 36.7 mmol) in THF (100 mL, followed by a 4 mL rinse) was added via a cannula. The mixture was stirred at -78 °C for 1 h, at 0 °C for 15 min at 23 °C for 5 min. The mixture was cooled to 0 °C and the iodide (5.08 g, 17.5 mmol) was added neat to the reaction via a cannula. After being stirred for 18.5 h at 0 °C, the reaction mixture was treated with half-saturated aqueous ammonium chloride solution (180 mL), and the resulting mixture was extracted with EtOAc (4 x 100 mL). The combined organic extracts were dried over sodium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by flash chromatography eluting with ether:hexanes (65:35) to afford 6.52 g (97%) of the amide as a white solid.

Novel Automation: a “Collective Intelligence” Approach

The system should be capable of:

- learning to interact with new objects and devices as the need to use these items arises
- Improved dexterity by using an anthropomorphic hand to replace the expensive and limited end-tool changing approach
- Usable Artificial Intelligence:
 - various parts of the system may work without being aware of the rest of the system, making decisions just based on the input from simple sensors
 - The final outcome though appears intelligent to the outside observer (*cf* ants and bees)
 - This is in contrast to conventional AI which uses top-to-bottom decision making

Anthropomorphic Automation With Collective Intelligence

- Anthropomorphic automation
- Standard labware
- Collective intelligence devices
- This set up for a Heck reaction

Intuitive, Flexible Software

A chemist can easily set up another reaction which uses different reagents and glassware using what the system has learned so far

Flexible Interaction with New Instruments: Analysis Trigger

- User can add a “look for value” command to actions
- Software will look for a required value e.g. mass ion or % conversion before proceeding
- Communication via Arduino

Flexible Interaction with New Instruments: Phase Separation

- Collective intelligence approach
 - Sensor triggered by robot gesture to initiates work up
 - Works up and delivers back to system for next step
- Conductivity cell
 - Microfluidic cell with sintered electrodes
- Proprietary algorithm
 - Determines phase boundary even if partially miscible solvents (e.g. DMF) drag salts into organic phase
- Aspiration through cell breaks emulsions (tested with Sonogashira and DiBAL reductions)

Improved Dexterity: Fine Motor Grasps

- Additional software to enable easier programming of fine motor manipulations
- Robot can now handle small objects reliably:
 - Weighing boat
 - Vial
 - Pen
 - Screw top
